Electra-Saver® II

Direct Drive, Slow Speed, Premium Quality Rotary Screw Compressors 40–200 HP 60 Hz, 45–112 kW 50 Hz

Electra-Saver II Models

The **150 HP ELECTRA-SAVER II**® is a gearless, direct drive compressor built to provide results.

Our Philosophy

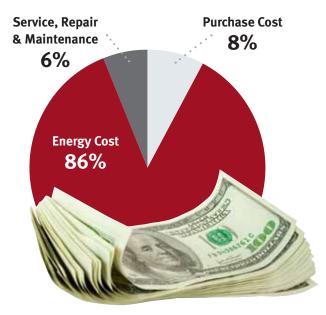

THE APPLICATION DRIVES THE COMPRESSOR TYPE

Many manufacturers try to sell one type of compressor for all applications. The truth is, compressor selection should follow an analysis of the application.

One type of compressor does not fit all needs. That's why Gardner Denver® offers the broadest line of machines and control options in the industry. If you want the right compressor, you need choices.

At Gardner Denver, we manufacture a variety of compressors for all your needs and applications.

COST OF COMPRESSED AIR OVER 5 YEARS

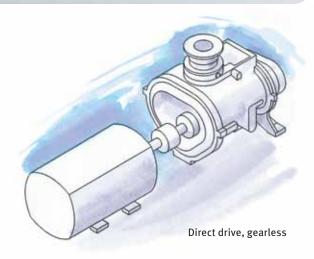

HIGHER INITIAL COST, LOWEST TOTAL COST

At Gardner Denver, we know the Electra-Saver II® rotary screw air compressor will cost more to purchase than other brands. That's because Gardner Denver compressors are designed to be "low cost provider of air over the product's life" when all costs—energy, maintenance, repair and purchase price are considered. Since the design objective is lowest total cost—energy efficiency, reliability and long-term durability are given paramount consideration. Take a look at Gardner Denver compressors and you will agree that the incremental purchase cost of an Electra-Saver II is easily justified by lower total operating costs.

Why direct drive, slow speed compressors?

BIGGER IS BETTER – GREATER ENERGY EFFICIENCY

The only reason to make a compressor airend small and turn it at high speed is to minimize production cost. To maximize energy efficiency, the airend should be large and run at slow speed, typically 1800 RPM. Why? For several reasons:

SLOW SPEED DESIGN – 100 HP Example

The Gardner Denver ST 100 has a dedicated 227 mm rotor set that turns at 1780 RPM. This gear-less unit produces 490 CFM and requires 105.5 BHP at full load for a BHP/100 CFM – an indication of efficiency – of 21.5.

A typical competitor's gear-driven unit turns 85% faster at 3300 RPM because the 178 mm rotor set is 22% smaller. This unit produces 483 CFM requiring 110 BHP for a less efficient BHP/100 CFM of 22.8. The 6% efficiency advantage of the Gardner Denver unit generates about \$2,700 in energy

COMPRESSED AIR IS NOT FREE

Choose the nominal size of an air compressor and cost of electricity to estimate annual energy costs.

Nominal	Operating Cost per Year (5000 hours) at Cost per kWh (\$)				
HP	.04	.06	.08	.10	.12
10	\$ 1,834	\$ 2,751	\$ 3,667	\$ 4,584	\$ 5,501
15	2,705	4,058	5,411	6,763	8,116
25	4,474	6,712	8,949	11,186	13,423
30	5,329	7,993	10,657	13,321	15,986
50	8,824	13,235	17,647	22,059	26,471
75	13,081	19,621	26,162	32,702	39,242
100	17,441	26,162	34,822	43,603	52,323
150	25,914	38,871	51,827	64,784	77,741
200	34,552	51,827	69,103	86,379	103,655
300	51,181	76,771	102,362	127,952	153,543
400	68,241	102,362	136,482	170,603	204,723
500	85,036	127,554	170,073	212,591	255,109

Note: Hours of operation based on two 8-hour shifts, six days a week. BHP based on nominal horsepower plus 10%.

GEAR-LESS OPERATION

A true direct drive unit operates at motor rpm without speed-increasing gears. Gears consume power in the form of mechanical losses. Thus, direct drive, slow speed, gear-less compressor airends have a 3–5% efficiency advantage—by design.

REDUCED AIR BLOW BACK

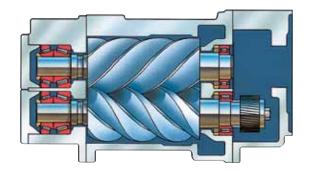

At high speeds, more air leaks across the rotors during the compression process. Simply put, the faster rotors turn, the harder it is to trap and hold all the air that is compressed. Rotor production technique cannot offset the advantage of slower speeds since large rotors can be machined to the same tolerances as small ones. Also, some smaller airends even require sealing strips to reduce this blow back. To maximize efficiency, minimize speed!

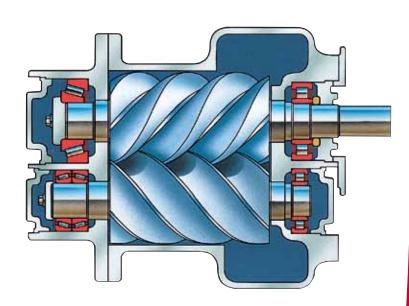

REDUCED LUBRICANT DRAG

In an airend, the rotors have to "cut through" heat reducing lubricant. And the fact is, less drag on the rotors occurs at slower speeds. In addition, lubricant is intensively injected into Gardner Denver airends through numerous ports rather than isolated to a single point, further reducing viscous drag. Every area of the Gardner Denver compressor is designed to maximize energy efficiency.

SMALLER LEAKAGE AREAS AS A PERCENTAGE OF AIR OUTPUT

Though this sounds technical, it is quite simple. The areas between the rotors and the rotor housing are leakage areas where air can escape, thus reducing efficiency. As rotor size increases, this leakage becomes a smaller percentage of air output. Think of a small and large circle where the circumference represents leakage points and the area of the circle represents air output. For a circle with a 10" diameter, the circumference (i.e. leakage area) is 40% of the area (air output).

Up to 41% larger, Gardner Denver airends operate more slowly and efficiently than smaller, gear-driven products.

Double the diameter to 20" and the circumference (leakage area) becomes just 20% of the area (air output). In summary, leakage areas have less influence on performance when you make a compressor large and turn it slowly.

Bigger is better!

Thousands of Hours of Reliable Use

LARGE, DURABLE, SUPER-SIZED BEARINGS

Of course, a larger rotor weighs more than a small rotor, so you would expect it to have larger bearings. The key, however, is that large rotors provide more area to "super-size" the bearings. That's why for years Gardner Denver has been one of the few manufacturers to quote bearing life in our literature. When you super-size this critical component, you're proud to say you design for a minimum L10 life of 100,000 hours.

Premium Package Features

COOL AIR THROUGH PROPER COOLING

Some compressors overheat or deliver hot air when the going gets tough. This happens when heat exchangers are downsized to cut cost. All Electra-Saver II heat exchangers are sized for operation in 115° F ambient while delivering air to within 15° F of the inlet air temperature. Big coolers, big airends...big difference.

STAINLESS STEEL RATHER THAN HOSE

Our premium compressor utilizes seamless stainless steel control lines and tubing for lubricant circulation. If offered by a competitor, it can cost an additional \$400-\$1500. Why accept leaks and long-term failures when you don't have to?

DIRECT DRIVE, GEAR-LESS COMPRESSOR AIREND

For decades, the trademark of these premium compressors has been service life. Direct drive, gear-less airends typically run for more than 10 years. (See pages 4–7 for details).

THE BEST MOTOR IN THE BUSINESS

Other brands are less expensive, but the Electra-Saver II motor is the most durable motor available. These cast iron, EISA premium efficiency motors contain more winding material than any other motor. The best motor with the best compressor provides the best drive train you can buy. These motors come with a standard 5-year warranty.

HEAVY DUTY, TWO-STAGE INLET FILTER

An inlet filter is no place to cut corners. Dirt and dust that enter the compressor greatly impact lubricant and machine life. This 5 micron filter is 99% efficient and standard on the Electra-Saver II. This feature is a separate option on many compressor designs.

SERVICEABILITY SUPREME

Our "bigger is better" design also means superior serviceability. Maintenance personnel love the Gardner Denver Electra-Saver II. Components are accessible, not crammed into a constrictive footprint like with other brands. All filters are easily accessible and piping need not be disconnected to service the separator.

OPTIONAL ENCLOSURE

lectra-Saver II

Why pay for an enclosure you don't need? Many installations are better off without one. When of benefit, Gardner Denver can supply an enclosure that is right for the installation. The Electra-Saver II design allows you to put your money where you benefit most.

AirSmart™ Microprocessor Controller

Never Out of Control

Electra-Saver II compressors use microprocessor control technology because it's the simplest, yet most powerful compressor control design available. These controllers are built on the foundation of being easy to operate and read, so you just push a button and get back to work. Then if service is necessary or a problem exists with the compressor, the controller communicates the need. With the AirSmartTM controller, you don't waste time troubleshooting or tracking service requirements. Electra-Saver II controllers are designed to take control!

AirSmart™

AirSmart[™] Microprocessor Controller

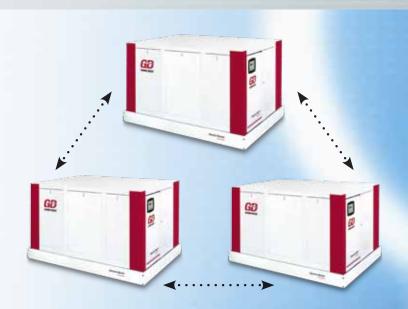

- Low voltage 24 VDC operation
- Two pressure transducer inputs
- Informative control panel
 - 4 line by 20 character LCD display
 - 4 status LEDs for "at a glance" compressor status
 - 9 buttons for easy control and menu navigation
 - Multiple language support
- The controller is feature rich with maintenance and error handling information including:
 - 29 different sources for advisories
 - 68 different sources for system shutdown
 - Advisory/shutdown history stored in nonvolatile memory
 - > Last 6 advisories
 - > Last 6 shutdowns
 - Distributor contact information
- Part number is displayed when consumable item causes advisory or shutdown
- Sequence capability for control of up to eight AirSmart™ controlled compressors*
- RS-232 serial communications for local monitoring*
- Ethernet communications for remote monitoring*
- * With optional communications/sequencer module.

Sequencing & Remote Monitoring

Communication & Sequencing

The optional communication module allows the Electra-Saver II Series units to talk to each other and other Gardner Denver compressors to optimize system efficiency. This isn't just an hour balancing, on/off sequencing scheme. Our controller allows the system to truly optimize efficiency because it knows the capabilities of other machines and orchestrates their operation.

The communication module also allows the option of remote monitoring the Electra-Saver II units.

ESP 20/20 Compressor Remote Monitoring System

ESP 20/20 is a wireless remote monitoring solution that upgrades the air compressor to an intelligent asset providing system performance and advisory notification. Interfacing directly to Gardner Denver or third party compressors via discrete inputs and outputs, any compressor asset can be transformed to provide critical operational information through a single web-based application.

SYSTEMS CHECK

- **√** Optimal Operation
- √ Increased Reliability
- √ Maximum Efficiency

GD TRA

10 Year Protection

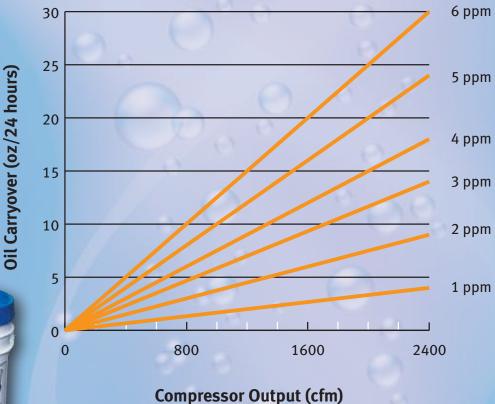

ESP 20/20 qualifies the compressor for *GDXTRA*, Gardner Denver's extended warranty program on airends, delivering the tools to ensure the compressor is operating at peak performance with the peace of mind that the compressor is protected.

Lowest Total Cost through Genuine GD Parts

Gardner Denver filters and separators are simply the highest quality parts available. Attention is given to every detail. O-ring gaskets are designed to stay in place and resist cracking. Protective mesh keeps filter media securely in place. Choosing a Gardner Denver filter or separator eliminates problems such as clogged oil lines, that result in failed compressor airends. Don't be fooled by cheaper "will fit" filters—the expense is greater to you in the long run.

LOW OIL CARRYOVER SAVES YOU CASH

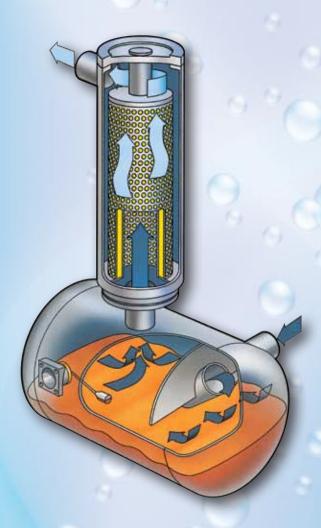

Remember, oil carryover costs 15¢ to 35¢ per ounce or \$20 to \$45 per gallon. Genuine parts minimize oil carryover.

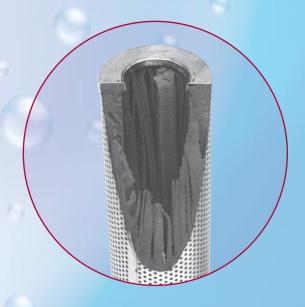

LUBRICANTS EXTRAORDINAIRE

AEON® Lubricants contain a design-specific additive package that cannot be duplicated by other brands. The result is everything you want in a lubricant—long life, thermal and oxidative stability, high flash point, superior film strength, low oil carryover and more. These non-hazardous lubricants separate quickly from water to minimize disposal cost and maximize protection. Using AEON Lubricants guarantees lowest total lubricant cost over the life of your compressor.

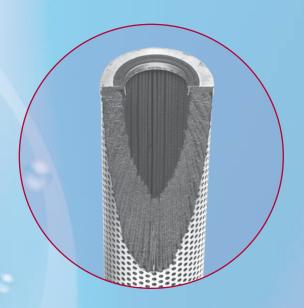

Patented ELIMINATOR™ Air-Oil Separator, inside our specially designed oil reservoir and tower, limits oil carryover to less than 2 PPM by weight – the lowest in the industry. Notice that piping connections do not have to be broken to service the separator element.

FILTER CUTAWAYS

Top: Replicator Filter without protective mesh allows filter media to migrate downstream.

Below: Genuine Gardner Denver Filter contains a protective mesh layer that keeps filter media intact.

History, Stability, & Dependability

Gardner Denver's engineering ingenuity began in Quincy, IL, a Mississippi River town, in 1859. Gardner Denver today continues to be a stable, dependable partner for the world's demanding and ever-changing industrial product needs.

Experience Proven Results

- 150 Years of Manufacturing Excellence
- 110 Years of Air Compressor Engineering
- 50 Years of Rotary Screw Compressor Innovation

Quality & Reliability

- Commitment to Direct Drive Technology
- Large rotors and bearings for greater efficiency and slow speed operation for longer life (rotor size comparison below)
- Variable speed design with matched motor, drive, and airend for maximum energy efficiency and superior reliability

Customer Service

- Headquarters in Quincy, IL USA
- Thousands of installations worldwide
- Gardner Denver Authorized Distributors: average 20+ years of compressed air experience
- Experienced, dependable service technicians
- Sales consultants that know the correct compressed air product for each compressed air application

Total System Solutions

SERVICEABILITY & PRODUCT SUPPORT

Support Network

Gardner Denver has a network of trained service providers available whenever needed to keep your compressors in top form. We are committed to stocking components to support your compressed air system needs.

Gardner Denver, an ENERGY STAR PARTNER, is

committed to developing products and introducing technologies that help conserve energy and protect the environment.

LET GARDNER DENVER TAKE CONTROL OF YOUR SYSTEM

To ensure total system reliability, Gardner Denver provides a broad range of dryers, filters, oil/water separators, drains, cleaning fluids, and aftercoolers. ONE-STOP shopping from Gardner Denver assures that all components of the system are designed to work together and are backed by customer support today and for years to come.

FIL Series High Efficiency Filters

A full range of filters 20–21,250 cfm; coalescing, particulate, and activated carbon for the removal of water, oil, and particulates from compressed air.

DS2 Series Evacuator Drain Valves

A full family of zero air loss, energy efficient demand drains. Ruggedly designed to effectively and reliably prevent moisture damage to dryers, air tools, gauges, and other critical components.

RNC Series Refrigerated Dryers

A full line of high quality refrigerated dryers with features and benefits unmatched by the competition. Designed to produce dew points as low as 38° F in compressed air.

DGH Series Desiccant Dryers

A complete line of desiccant dryers for the removal of water vapor in compressed air to dew points as low as -100° F.
